- 4 Third Part

## Papoulis Exercise 5-51

A box contains  $N$  identical items of which  $M < N$  are defective ones. A sample of size  $n$  is taken from the box, and let  $X$  represent the number of defective items in the sample.

- 1 Find the distribution function of  $X$  if the  $n$  samples are drawn with replacement.
- 2 If the  $n$  samples are drawn without replacement, then show that

$$\Pr(X = k) = \frac{\binom{M}{k} \binom{N-M}{n-k}}{\binom{N}{n}} \quad \max(0, n + M - N) \leq k \leq \min(M, n) \quad (1)$$

Find the mean and variance of  $X$ . This distribution is known as the hypergeometric distribution.

- 3 In the previous equation, let  $N \rightarrow \infty$ ,  $M \rightarrow \infty$  such that  $\frac{M}{N} \rightarrow p$ ,  $0 < p < 1$ . Then show that the hypergeometric random variable can be approximated by a binomial random variable with parameters  $n$  and  $p$  provided  $n \ll N$

# First Part

Let there be  $k$  defective items among the  $n$  chosen samples. Since we are drawing with replacement, the distribution will be a binomial distribution with parameters  $n$  and  $p = \frac{M}{N}$  where  $p$  is the probability that a randomly chosen sample is defective.

$$f_X(k) = \binom{n}{k} p^k (1-p)^{n-k}, \quad k \in \{0, 1, \dots, n\} \quad (2)$$

$$= \binom{n}{k} \left(\frac{M}{N}\right)^k \left(\frac{N-M}{N}\right)^{n-k}, \quad k \in \{0, 1, \dots, n\} \quad (3)$$

$$= \binom{n}{k} \frac{M^k (N-M)^{n-k}}{N^n}, \quad k \in \{0, 1, \dots, n\} \quad (4)$$

## Second Part

Now we are drawing without replacement.  $n$  samples can be chosen from  $N$  items in  $\binom{N}{n}$  ways. Out of these,  $k$  defective samples can be chosen from a total of  $M$  defective items in  $\binom{M}{k}$  ways and the remaining  $n - k$  samples can be chosen from the  $N - M$  non-defective items in  $\binom{N-M}{n-k}$  ways. Thus, the total number of ways of choosing  $k$  defective and  $n - k$  non-defective items is

$$\binom{M}{k} \binom{N-M}{n-k} \quad (5)$$

Therefore, the probability is given by

$$\Pr(X = k) = \frac{\binom{M}{k} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (6)$$

The constraints on  $k$  can be obtained as follows:

$$k \geq 0, n - k \leq N - M \quad (7)$$

$$\implies k \geq \max(0, n + M - N) \quad (8)$$

$$k \leq M, n - k \geq 0 \quad (9)$$

$$\implies k \leq \min(M, n) \quad (10)$$

$$\therefore \max(0, n + M - N) \leq k \leq \min(M, n) \quad (11)$$

# Mean

The mean of  $X$  is given by

$$E[X] = \sum_k k \Pr(X = k) \quad (12)$$

$$= \sum_k \frac{k \binom{M}{k} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (13)$$

$$k \binom{M}{k} = k \frac{M!}{k!(M-k)!} = M \frac{(M-1)!}{(k-1)!(M-k)!} = M \binom{M-1}{k-1} \quad (14)$$

$$\binom{N}{n} = \frac{N!}{n!(N-n)!} = \frac{N}{n} \frac{(N-1)!}{(n-1)!(N-n)!} = \frac{N}{n} \binom{N-1}{n-1} \quad (15)$$

$$\Rightarrow E[X] = \sum_k \frac{M \binom{M-1}{k-1} \binom{N-M}{n-k}}{\frac{N}{n} \binom{N-1}{n-1}} \quad (16)$$

$$E[X] = \frac{Mn}{N} \frac{\sum_k \binom{M-1}{k-1} \binom{N-M}{n-k}}{\binom{N-1}{n-1}} \quad (17)$$

By Vandermonde's identity,

$$\sum_i \binom{a}{i} \binom{b}{r-i} = \binom{a+b}{r} \quad (18)$$

Combinatorially, this can be shown by counting the number of ways to select  $r$  fruits from a basket consisting of  $a$  apples and  $b$  oranges. This is equal to the sum over all possible values of  $i$ , of the number of ways to select  $i$  apples and  $r - i$  oranges.

$$\Rightarrow \sum_k \binom{M-1}{k-1} \binom{N-M}{n-k} = \sum_k \binom{M-1}{k-1} \binom{N-M}{(n-1)-(k-1)} \quad (19)$$

$$= \binom{N-1}{n-1} \quad (20)$$

$$\Rightarrow \frac{\sum_k \binom{M-1}{k-1} \binom{N-M}{n-k}}{\binom{N-1}{n-1}} = 1 \quad (21)$$

Therefore,

$$E[X] = \frac{Mn}{N} \quad (22)$$

# Variance

The variance of  $X$  is given by

$$\text{Var}(X) = E[X^2] - (E[X])^2 \quad (23)$$

$$E[X^2] = \sum_k k^2 \Pr(X = k) \quad (24)$$

$$= \sum_k \frac{k \cdot k \binom{M}{k} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (25)$$

$$= \sum_k \frac{k \cdot M \binom{M-1}{k-1} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (26)$$

$$= M \sum_k \frac{(k-1+1) \binom{M-1}{k-1} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (27)$$

$$(28)$$

$$E[X^2] = M \sum_k \frac{(k-1) \binom{M-1}{k-1} \binom{N-M}{n-k}}{\frac{N(N-1)}{n(n-1)} \binom{N-2}{n-2}} + M \sum_k \frac{\binom{M-1}{k-1} \binom{N-M}{n-k}}{\frac{N}{n} \binom{N-1}{n-1}} \quad (29)$$

$$= \frac{Mn(n-1)}{N(N-1)} \sum_k \frac{(M-1) \binom{M-2}{k-2} \binom{N-M}{n-k}}{\binom{N-2}{n-2}} + \frac{Mn}{N} \quad (30)$$

$$= \frac{M(M-1)n(n-1)}{N(N-1)} + \frac{Mn}{N} \quad (31)$$

following a similar computation as that done for the mean

$$\text{Var}(X) = E[X^2] - (E[X])^2 \quad (32)$$

$$= \frac{M(M-1)n(n-1)}{N(N-1)} + \frac{Mn}{N} - \left(\frac{Mn}{N}\right)^2 \quad (33)$$

$$\text{Var}(X) = \frac{Mn}{N} \left( \frac{(M-1)(n-1)}{N-1} + 1 - \frac{Mn}{N} \right) \quad (34)$$

$$= \frac{Mn}{N} \frac{N(M-1)(n-1) + N(N-1) - Mn(N-1)}{N(N-1)} \quad (35)$$

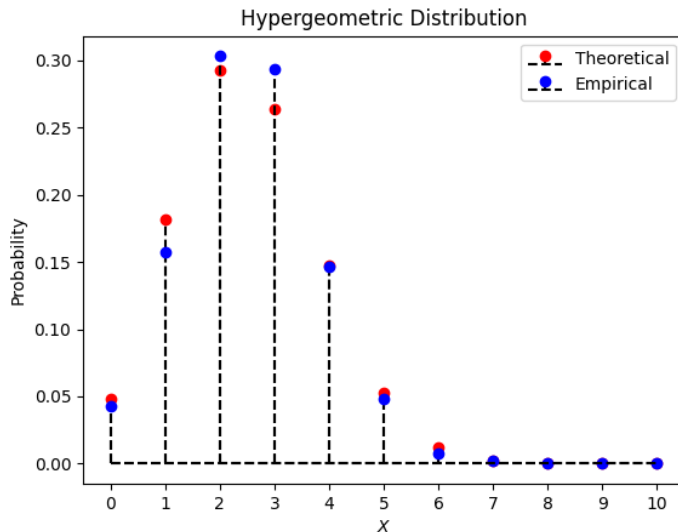

$$= \frac{Mn}{N^2(N-1)} (NMn + N - NM - Nn + N^2 - N - NMn + Mn) \quad (36)$$

$$= \frac{Mn}{N^2(N-1)} (N(N-M) - n(N-M)) \quad (37)$$

Therefore,

$$\text{Var}(X) = \frac{Mn(N-n)(N-M)}{N^2(N-1)} \quad (38)$$

# Plot of the distribution for $N = 100, M = 25, n = 10$

# Third Part

$$\Pr(X = k) \quad (39)$$

$$= \frac{\binom{M}{k} \binom{N-M}{n-k}}{\binom{N}{n}} \quad (40)$$

$$= \frac{M!}{k!(M-k)!} \frac{(N-M)!}{(n-k)!(N-M-n+k)!} \frac{n!(N-n)!}{N!} \quad (41)$$

$$= \frac{n!}{k!(n-k)!} \frac{M \cdots (M-k+1)}{N \cdots (N-k+1)} \frac{(N-M) \cdots (N-M-n+k+1)}{(N-k) \cdots (N-n+1)} \quad (42)$$

$$= \binom{n}{k} \frac{M^k \left(1 - \frac{1}{M}\right) \cdots \left(1 - \frac{k-1}{M}\right) (N-M)^{n-k} \left(1 - \frac{1}{N-M}\right) \cdots \left(1 - \frac{n-k-1}{N-M}\right)}{N^k \left(1 - \frac{1}{N}\right) \cdots \left(1 - \frac{k-1}{N}\right) (N-k)^{n-k} \left(1 - \frac{1}{N-k}\right) \cdots \left(1 - \frac{n-k-1}{N-k}\right)} \quad (43)$$

Now,  $N \rightarrow \infty, M \rightarrow \infty$  such that  $\frac{M}{N} \rightarrow p, 0 < p < 1$

$$\implies N - M \simeq N(1 - p) \rightarrow \infty \quad (44)$$

$$\text{and } k \leq n \ll N \implies N - k \simeq N \rightarrow \infty \quad (45)$$

Thus,

$$\Pr(X = k) \simeq \binom{n}{k} \frac{M^k}{N^k} \frac{(N - M)^{n-k}}{N^{n-k}} \quad (46)$$

$$= \binom{n}{k} p^k (1 - p)^{n-k} \quad (47)$$

where  $p = \frac{M}{N}$

Therefore, the hypergeometric random variable can be approximated by a binomial random variable with parameters  $n$  and  $k$ .  $\square$

Plot as  $N, M \rightarrow \infty, \frac{M}{N} \rightarrow p, 0 < p < 1, n \ll N$
